ABDULRAHMAN BELLO

Software Engineer | AI Evaluation & Training Data

belloabdulrahmon345@gmail.com | github.com/fabulouschase2 | Canada

PROFILE SUMMARY

Software engineer with 5+ years building and shipping real systems — Python/Django/React/SQL and asyncio network infrastructure — and 3+ years evaluating frontier AI model outputs at Turing, Mindrift, and Outlier/OneForma with rubrics, golden standards, and citation-supported rationales. Founded and engineered Chopbit end to end (2,000+ active users); built ProxyForge, an asyncio proxy server with health-aware rotation and a REST API. Strong engineering taste applied to evaluation: rubrics and reward signals that capture real engineering value, not just "does it compile."

CORE SKILLS

Software Engineering: Python (primary), Django, REST APIs, React / JavaScript, SQL / SQLite, asyncio, Git & GitHub, software testing, code review, API debugging

Systems & Environments: Proxy / networking (HTTP CONNECT, SOCKS4/5), concurrent health checking & weighted scoring, SQLite data design, REST API design, automated test harnesses

AI Evaluation & Data: Rubric design & iteration, golden sets, factuality & safety assessment, hallucination detection, peer review feedback, Label Studio, CVAT

WORK EXPERIENCE

AI Model Evaluator | Turing — Oct 2026 – Present

- Evaluate frontier AI model responses for accuracy, relevance, completeness, and safety against project-specific rubrics and labeling guidelines.
- Write citation-supported, evidence-based rationales that convert evaluation judgments into reliable training signal — every judgment traceable to verifiable evidence.
- Identify ambiguous and edge-case samples and escalate with reasoned documentation, keeping decisions consistent and reproducible at high volume.

Data Annotator / QA Expert | Mindrift — May 2026 – Jul 2026

- Performed high-volume structured annotation and quality review against detailed labeling guidelines, including hands-on assessment of peer annotators' coding and reasoning output.
- Compared AI-generated responses against prompts and evaluation criteria for safety, helpfulness, and factuality; flagged ambiguous samples with reasoned explanations that tightened taxonomy definitions.

Founder & Software Engineer | Chopbit — Mar 2025 – Dec 2025

- Founded and engineered a usage-analytics and product-intelligence platform serving 2,000+ active users — owned architecture, development, testing, QA, deployment, and iteration end to end.
- Built the full stack: Python/Django REST APIs, React frontend, and SQL/SQLite data layer, with internal quality-control standards and automated review checks before every release.
- Diagnosed and resolved issues across frontend, backend, API, and database layers; analyzed API responses and application data to support engineering decisions.

Content Evaluation & Quality Assessment | Outlier & OneForma — 2023 – 2025

- Two-plus years of rubric-based content review, fact-checking, and evidence-based written assessments on AI-related projects, delivered independently on remote, project-based assignments.

Software Engineer & Product Developer | Independent / Freelance — 2021 – Present

- Design, develop, test, and deploy full-stack web applications (Python, Django, React, REST APIs, SQL/SQLite, Git), owning requirements, testing, and deliverable standards.

PROJECT

ProxyForge — Self-Hosted Rotating Proxy Service | Developer — Python / asyncio

- Built from scratch: an asyncio proxy server supporting HTTP CONNECT and SOCKS4/5 upstreams, with a concurrent checker validating thousands of proxies for latency, anonymity, and HTTPS tunneling.
- Designed health-aware rotation — weighted scoring by latency, success rate, and anonymity — plus sticky sessions, country targeting, and automatic retry on failed upstreams, backed by a SQLite pool and REST API.

EDUCATION

M.S., Software Engineering | Carnegie Mellon University — 2025

B.S., Computer Science | Columbia University — 2019
